PROTECT.
[WHAT IS IT?]

MFA or 2FA adds an additional layer of protection to ensure that even if your password does get stolen, your data stays protected by preventing hackers from accessing your systems.

PREVENT.
[WHY DO I NEED IT?]

User credentials can be easily compromised. When MFA is enabled, hackers cannot log in as you to your work systems, bank accounts, and have full access to your personal and private data.

SECURE.
[CMIT PROTECTION]

CMIT can enable MFA for your users for various systems in order to protect them and your company from compromise and data breaches.
