

5 Reasons You Need a Business Firewall in Casper

Considering a Business Firewall?

With more and more modern businesses moving to the cloud, many wonder whether or not investing in a business firewall in Casper is necessary. We're here to tell you that it is, in fact, necessary. Let's take a look at a few of the main reasons why:

1. Your Internal IT Equipment is Still Vulnerable

No matter how strong your [cloud security](#) is, your computers and internal network are still [vulnerable to a potential cyber attack](#). From your computers and servers to wireless hardware and printers, there are plenty of pieces of IT equipment that are open to attack. And if you're not utilizing a business firewall in Casper, all of these things will remain unprotected and susceptible to cyber threats.

2. Protects You From the Internet

Let's say an employee is on break. They're on their computer checking social networks and browsing different websites. All of a sudden, they stumble on a site that isn't secure. As a result, malicious software infects their computer. Since the employee didn't realize their computer was infected, they access the cloud and get back to work as usual. The result? Any piece of data exchanged between the cloud and your employee's computer can now be unknowingly intercepted. That presents a big problem for your business. And it's one of the biggest reasons that investing in a business firewall in Casper is a must.

3. Provides a Multi-Layered Defensive Approach

If a football team ran the same play on defense every time out, it wouldn't take long before the offense caught on and started dominating them. In both the football and IT world, a multi-layered defensive approach is necessary to ensure protection. Without it, you make it far too easy for the offense (aka hackers) to penetrate your defenses and steal your internal data.

4. Acts as a Gatekeeper

Another one of the major reasons that utilizing a business firewall in Casper is necessary is due to its ability to act as a gatekeeper for your data. With a firewall, every piece of data that runs through your router is automatically vetted before making its way onto your internal drives. This ensures that both company and customer data is protected on a 24/7 basis.

5. Most Businesses Don't Survive Cyber Attacks

Here's the harsh reality...if your business experiences a cyber attack, there's a better than 50% chance that you won't make it past the next 6 months. In fact, according to research from the National Cyber Security Alliance, as many as [60%](#) of hacked businesses go out of business within six months of a cyber attack. At the end of the day, the risk is simply not worth taking. Especially when investing in a business firewall in Casper can all but guarantee that you'll avoid a major cyber security breach.

Take Cyber Security Seriously

The future of your business depends on your ability to protect yourself from cyber attacks. Don't make the mistake of thinking cyber security is a perk rather than a necessity. Invest in cyber security. Protect your business. Your short and long term success depends on it.
